Wireless Networks in Computer Networks

- ❑ Computer networks that are not connected by cables are called wireless networks. They generally use radio waves for communication between the network nodes. They allow devices to be connected to the network while roaming around within the network coverage.

Types of Wireless Networks

- ❑ **Wireless LANs** – Connects two or more network devices using wireless distribution techniques.
- ❑ **Wireless MANs** – Connects two or more wireless LANs spreading over a metropolitan area.
- ❑ **Wireless WANs** – Connects large areas comprising LANs, MANs and personal networks.

- ❑ **Wireless PANs** – Connects personal devices nearby, allowing them to communicate with each other within a small area.
